

0.25 LSB GaAs MMIC 6-BIT DIGITAL ATTENUATOR, DC - 6 GHz

Typical Applications

The HMC792ALP4E is ideal for:

- Cellular/3G Infrastructure
- WiBro / WiMAX / 4G
- Microwave Radio & VSAT
- Test Equipment and Sensors
- IF & RF Applications

Features

- 0.25 dB LSB Steps to 15.75 dB
- Power-Up State Selection
- High Input IP3: +53 dBm
- Low Insertion Loss: 1.8 dB @ 2.0 GHz
- TTL/CMOS Compatible, Serial, Parallel or Latched Parallel Control
- ±0.1 dB Typical Step Error
- Single +3V or +5V Supply
- 24 Lead 4x4mm SMT Package: 16mm²

Functional Diagram

General Description

The HMC792ALP4E is a broadband 6-bit GaAs IC Digital Attenuator in a low cost leadless SMT package. This versatile digital attenuator incorporates off-chip AC ground capacitors for near DC operation, making it suitable for a wide variety of RF and IF applications. The dual mode control interface is CMOS/TTL compatible, and accepts either a three wire serial input or a 6 bit parallel word. The HMC792ALP4E also features a user selectable power up state and a serial output port for cascading other Hittite serial controlled components. The HMC792ALP4E is housed in a RoHS compliant 4x4 mm QFN leadless package, and requires no external matching components.

Serial Control Interface

The HMC792ALP4E contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). The serial control interface is activated when P/S is kept high. The 6-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches are used, sufficient debouncing should be provided. When LE is high, 6-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

When P/S is low, 3-wire SPI interface inputs (SERIN, CLK, LE) are disabled and the input register is loaded with parallel digital inputs (D0-D5). When LE is high, 6-bit parallel data changes the state of the part per truth table.

For all modes of operations, the attenuation state will stay constant while LE is kept low.

0.25 LSB GaAs MMIC 6-BIT DIGITAL ATTENUATOR, DC - 6 GHz

Timing Diagram (Latched Parallel Mode)

| Parameter | Typ. |
|---|--------|
| Min. serial period, t_{SCK} | 100 ns |
| Control set-up time, t_{CS} | 20 ns |
| Control hold-time, t_{CH} | 20 ns |
| LE setup-time, t_{LN} | 10 ns |
| Min. LE pulse width, t_{LEW} | 10 ns |
| Min LE pulse spacing, t_{LES} | 630 ns |
| Serial clock hold-time from LE, t_{CKN} | 10 ns |
| Hold Time, t_{PH} | 0 ns |
| Latch Enable Minimum Width, t_{LEN} | 10 ns |
| Setup Time, t_{PS} | 2 ns |

Parallel Mode (Direct Parallel Mode & Latched Parallel Mode)

Note: The parallel mode is enabled when P/S is set to low.

Direct Parallel Mode - The attenuation state is changed by the control voltage inputs D0-D5 directly. The LE (Latch Enable) must be at a logic high at all times to control the attenuator in this manner.

Latched Parallel Mode - The attenuation state is selected using the control voltage inputs D0-D5 and set while the LE is in the Low state. The attenuator will not change state while LE is Low. Once all Control Voltage Inputs are at the desired states the LE is pulsed. See timing diagram above for reference.

Power-Up States

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of D0-D5 determines the power-up state of the part per truth table. The attenuator latches in the desired power-up state approximately 200 ms after power-up.

PUP Truth Table

| LE | PUP1 | PUP2 | Relative Attenuation |
|----|------|------|----------------------|
| 0 | 0 | 0 | -15.75 |
| 0 | 1 | 0 | -12 |
| 0 | 0 | 1 | -8 |
| 0 | 1 | 1 | Insertion Loss |
| 1 | X | X | 0 to -15.75 dB |

Note: The logic state of D0 - D5 determines the power-up state per truth table shown below when LE is high at power-up.

Power-On Sequence

The ideal power-up sequence is: GND, Vdd, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after Vdd / GND

Control Voltage Table

| State | Vdd = +3V | Vdd = +5V |
|-------|------------------------|------------------------|
| Low | 0 to 0.5V @ <1 μ A | 0 to 0.8V @ <1 μ A |
| High | 2 to 3V @ <1 μ A | 2 to 5V @ <1 μ A |

Truth Table

| Control Voltage Input | | | | | | Reference Insertion Loss |
|-----------------------|------|------|------|------|------|--------------------------|
| D5 | D4 | D3 | D2 | D1 | D0 | |
| High | High | High | High | High | High | 0 dB |
| High | High | High | High | High | Low | -0.25 dB |
| High | High | High | High | Low | High | -0.5 dB |
| High | High | High | Low | High | High | -1 dB |
| High | High | Low | High | High | High | -2 dB |
| High | Low | High | High | High | High | -4 dB |
| Low | High | High | High | High | High | -8 dB |
| Low | Low | Low | Low | Low | Low | -15.75 dB |

Any combination of the above states will provide an attenuation equal to the sum of the bits selected.

0.25 LSB GaAs MMIC 6-BIT DIGITAL ATTENUATOR, DC - 6 GHz

Application Circuit

For frequencies less than 700 MHz, the use of ACG capacitors C4, C5 and C6 is recommended. For frequencies greater than 700 MHz, the HMC792ALP4E has similar performance with and without the ACG capacitors.

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
